

OMV — Design Review

Phase 1 — Approved

Phase 2 — Approved

Live: omv-iota.vercel.app

Phase 3 — Awaiting your approval

This document walks through every screen built so far: what it's for, the UX decisions behind it, which reusable components it's built from, and how it behaves across devices and themes.

Phase 3 — Customer Dashboard

All eight pages below live under **/account**, sharing one DashboardShell (sidebar nav desktop, scrollable tab bar mobile). Every page carries the same "saved locally until Phase 5 auth" notice, stated once by the shell.

10. Account Overview (Profile)

Desktop — Dark theme

Desktop — Light theme

Mobile

UX decisions: The three stat cards are clickable shortcuts into Orders, Wishlist and Loyalty rather than static numbers.

Components: Card, Input, Button, `useProfile()`, `useOrders()`, `useWishlist()`. **Accessibility:** descriptive aria-labels on stat links.

Responsive: 3-col → 1-col stat cards; sidebar becomes mobile tab bar.

11. Addresses

UX decisions: First saved address is auto-default; a star icon promotes any other one — no separate edit flow needed for the common case.

Components: Card, Input, Button, useAddresses(). **Accessibility:** per-address descriptive aria-labels. **Responsive:** 2-col → 1-col below lg.

12. Orders (with Order Tracking)

Mobile

UX decisions: Real order history — orders placed through the actual checkout flow appear here automatically. Each order gets a 4-

step tracker (Placed → Processing → Shipped → Delivered); new orders start at "Processing" (a mocked but realistic mid-flight state, flagged in the log since there's no real fulfillment backend yet).

Components: Card, OrderTracker (new), useOrders(). **Accessibility:** tracker is a labelled role="list" announcing overall status.

Responsive: tracker steps wrap; cards stack full-width on mobile.

13. Loyalty & Rewards

UX decisions: Tier/points calculated from real local order history (1 pt per ₦1,000) — not a static number. Three tiers shown side by side with current one highlighted, plus a "X pts to next tier" nudge.

Components: Card, useOrders() (points derived, one source of truth). **Accessibility:** points/tier shown as plain text, not color-only. **Responsive:** tier cards 3-col → 1-col.

14. Notifications

UX decisions: Real toggle switches (role="switch"), not checkboxes styled as toggles — correct keyboard/screen-reader semantics.

Components: useNotificationPrefs(). **Accessibility:** aria-checked + channel-specific aria-label per switch. **Responsive:** single column at all sizes.

15. AI Fashion Assistant

Mobile

UX decisions: An honest, working preview — keyword-matching chat against the real product catalogue, clearly framed as a preview rather than pretending to be the full Phase 5 AI service. Purple is the primary color here (not just an accent) — the one deliberate exception matching Brand Book §15 ("purple = AI features"). Suggested products render inline as small cards, keeping it conversational.

Components: custom chat UI against PRODUCTS data (page-local state, not persisted). **Accessibility:** aria-live="polite" message list; visually-hidden input label. **Responsive:** bubbles/cards wrap naturally.

16. Outfit Builder

UX decisions: Tap-to-toggle selection on product tiles (gold border = selected) rather than drag-and-drop — more usable on mobile and just as fast for a small catalogue. Running total/save bar appears only once something is selected.

Components: Card, Button, useStyle() (new). **Accessibility:** each tile is a real button with aria-pressed and a state-aware label. **Responsive:** 4-col → 2-col grid.

17. Style Quiz

UX decisions: Result shown immediately and persists — returning later shows your existing profile with a "Retake" option rather than forcing the quiz again.

Components: Button, useStyle(). **Accessibility:** one question at a time with "Question X of Y" progress; full-width answer buttons for larger touch targets. **Responsive:** single column at all sizes.

What still needs your review (Phase 3)

- Order Tracking's "Processing" default status — every order starts there since there's no real fulfillment backend yet.
- Account dashboard accessible without real login — same interim approach as Family Shopping in Phase 2.
- AI Fashion Assistant as a keyword-matching preview — confirm this honestly-scoped-down approach is right for now.
- Addresses not yet wired into Checkout's address form — they're separate today.
- Anything missing from Phase 3's scope before Phase 4 begins.

Phase 1 & 2 — Previously Approved

Full page-by-page detail for Phase 1 (Foundation) and Phase 2 (Storefront) was reviewed and approved in earlier rounds. Summary retained here for reference; see prior REVIEW.pdf versions (OMV-v0.1, OMV-v0.2) for complete per-page detail and screenshots, all of which remain in **/preview** and in this project's REVIEW.md.

- **Phase 1:** Home/Landing, Sign In, Create Account — dark/light theme system, branding, responsive nav, accessibility foundation.
- **Phase 2:** Catalogue (Women/Men/Kids), Product Detail + Complete the Look, Wishlist, Cart, Checkout, Family Shopping.
