

OMV — Design Review

Phase 1 — Approved

Phase 2 — Approved

Phase 3 — Approved

Live: omv-iota.vercel.app

Phase 4 — Awaiting your approval

Phase 4 — Admin Portal

All ten sections live under **/admin**, sharing one AdminShell. The portal opens on a mock sign-in picker listing the 5 seeded administrators across 3 roles (Super/Business/Staff Admin), so RBAC is genuinely testable, not just described.

18. Sign In (Admin)

UX: one-click admin selection, no password (real auth is Phase 5). Role badge shown per row.

19. Dashboard

Light theme

Mobile

UX: every stat is real — revenue/orders from `useOrders()`, products/low-stock from admin product context, pending reviews from reviews context. Not a static mock screen.

20. Inventory

UX: inline +/- stock steppers directly in the table; sub-15-unit items flagged "Low stock." Every adjustment writes an Audit Log entry.

21. Products (Super/Business only)

UX: a genuinely separate admin-scoped catalogue, not a live storefront editor — clearly labeled. Syncing to the live storefront needs a real backend (some storefront pages render server-side), so this is honestly deferred to Phase 5 rather than faked.

22. Orders

Mobile (as Staff Admin)

UX: reuses the exact OrderTracker component from the customer dashboard — an admin advancing status here updates the same order a customer sees. Visible to all three roles including Staff.

23. Customers

UX: illustrative directory with Active/Blocked toggle — real accounts arrive with Phase 5 auth.

24. Promotions (Super/Business only)

UX: active/inactive is a single toggle chip, not a separate publish flow.

25. Reviews (Super/Business only)

UX: moderates an illustrative dataset since customer review submission isn't built into the storefront yet — this lets moderation UX be reviewed ahead of that.

26. Reports (Super/Business only)

UX: revenue, average order value, status breakdown and top products are all computed live from useOrders() — place a test order and these numbers move.

27. Audit Logs (Super Admin only)

UX: genuinely logs real admin actions across the portal — stock changes, product/promotion CRUD, review moderation, order status changes — satisfying the Product Bible's "every action is logged" rule.

28. Notifications

UX: seeded system alerts plus a real notification generated whenever a genuinely new order is placed through the storefront.

Architecture note

The Master Development Guide sketches a monorepo with separate apps/web and apps/admin. Phases 1-4 continue the pragmatic single-Next.js-app pattern established in Phase 1 — /admin is a route tree in the same app, not a separate deployable, keeping everything deployable to the single existing Vercel project.

What still needs your review (Phase 4)

- Single-app architecture instead of a separate apps/admin — confirm this continues into Phase 5.
- Admin product catalogue not synced to the live storefront — by design until Phase 5's backend.
- Mock customer directory and mock review dataset — both explicitly illustrative.
- RBAC role assignments — confirm the Super/Business/Staff matrix matches expectations.
- Anything missing from Phase 4's scope before Phase 5 begins.

Phases 1-3 — Previously Approved

Full page-by-page detail for Phase 1 (Foundation), Phase 2 (Storefront) and Phase 3 (Customer Dashboard) was reviewed and approved in earlier rounds. Complete detail and screenshots remain in **/preview** and in this project's REVIEW.md.

- **Phase 1:** Home/Landing, Sign In, Create Account — dark/light theme system, branding, responsive nav, accessibility foundation.
- **Phase 2:** Catalogue (Women/Men/Kids), Product Detail + Complete the Look, Wishlist, Cart, Checkout, Family Shopping.
- **Phase 3:** Account Overview, Addresses, Orders + Tracking, Loyalty, Notifications, AI Fashion Assistant, Outfit Builder, Style Quiz.
