

OMV — Design Review

Phase 1-3 — Approved Phase 4 — Deployed & tested Live: omv-iota.vercel.app

Phase 4 Refinement — Awaiting your approval

RBAC-aware dashboards, product variant/inventory architecture with real order sync, redesigned Family Shopping, mannequin-based Outfit Builder & Complete the Look, expanded Style Quiz, and new site announcements.

29. Role-Aware Admin Dashboard

Staff Admin

Super Admin (with Recent Admin Activity)

UX: Staff sees only what they can act on (Orders, Orders Needing Attention, Low Stock, Customers) — no Revenue/Products/Reviews. Super/Business share the fuller picture; only Super sees Recent Admin Activity.

30. Admin Product Detail — Variant Stock

UX: variant grid grouped by colour with size/stock rows, matching the requested format exactly. Colour-coded thresholds (gold=low, red=zero) make attention-needed variants scannable.

31. PDP — Colour + Size Variant Selection

UX: colour is now genuinely selectable; an out-of-stock size for the selected colour is struck through and disabled while other sizes remain selectable — the product stays visible, only that exact variant is blocked.

32. Complete the Look — Occasion-Based with Mannequin

Mobile

UX: full structured occasion catalogue drives real category/occasion filtering. The mannequin is deliberately abstract (no face/body), captioned as a stylized preview, not photography. Uncurated occasions show an honest empty state pointing to Outfit Builder.

33. Outfit Builder — Mannequin-Based

Mobile

UX: per-slot selection updates the shared mannequin live. Items matching the customer's real Style Quiz preferences are marked

Recommended — genuine personalization, not decoration.

34. Family Shopping — Redesigned Profile Model

UX: relationship is now open-ended (datalist-suggested, never blocked); clothing sizes split by category; dedicated shoe size; style/colour preference tags. Existing profiles migrate automatically.

35. Style Quiz — Redesigned

UX: grew from 3 to 8 plain-language questions producing structured preference data genuinely read by Outfit Builder's recommendation logic.

36. Site Announcements

Admin-managed dismissible storefront banner (visible in the Complete the Look screenshot above). Explicitly documented and UI-labeled as local-to-this-browser only until Phase 5's shared backend exists.

What still needs your review

- Inventory sync is client-side only and explicitly not concurrency-safe — Phase 5 must make check-and-deduct one atomic server-side transaction.
- Curated Complete the Look coverage is partial (4 of ~90 occasions) — a direct consequence of the small mock catalogue.
- Mannequin is intentionally abstract, not photographic — confirm this is the right interim solution.
- Announcement management restricted to Super/Business Admin — an assumption, not explicitly specified.
- Outfit Builder's "Add Look" auto-selects a variant rather than prompting per item.
- Anything missing from this refinement before Phase 5 begins.

Full page-by-page detail for Phases 1-4's original scope remains in REVIEW.md and prior REVIEW.pdf versions, all screenshots retained in /preview.
